Patrick:

Per our conversation: As suspected, it seems as if Environ did understand what rooms were tested since they have referenced them in this report... I am not sure why they would not tell you that they already tested these rooms when you asked them.

- Testing has included rooms reported by PEER and Malibu Unites as having elevated PCB concentrations in caulk:
 - – Sampling included JCES Room 19 that was identified by PEER and Malibu Unites as a room with high concentrations of PCBs in caulk. The air sample result for this room (120 ng/m³) is below USEPA's benchmark and the two wipe samples in this room are non-detects for PCBs.
 - – Air and wipe samples have been collected from other rooms reported to have been tested by PEER and Malibu Unites and those laboratory results are pending.

Sincerely,
Jennifer deNicola
